

FalconGrid Power Division

Internal Asset Inventory — Project Sentinel (OT Modernization Program)

Document ID:	FG-OT-2026-0143	Classification:	Internal
Prepared by:	OT Engineering, FalconGrid Power Division	Last Updated:	2026-02-18
Program:	Project Sentinel	Version:	1.3 (Draft)

1. Overview

Project Sentinel is FalconGrid Power Division's ongoing operational technology (OT) modernization initiative, covering remote monitoring and control gateways deployed across power generation and substation sites. This document provides an internal reference inventory of Sentinel-class gateway assets for engineering and vendor-support use. This document is not intended for distribution outside FalconGrid Power Division.

2. Remote Engineering Access Pilot

Sentinel gateways provide bridging between legacy SCADA/Modbus field devices and the central FalconGrid OT monitoring platform. As part of a limited pilot, a subset of gateways has been configured with a temporary remote access console — the **Industrial Gateway Management Console** — to allow the vendor support team to perform diagnostics without requiring a site visit or VPN setup. The pilot console exposes the following services: **HTTP (80)** for the web console, **S7comm (102)** for PLC diagnostics, and **Modbus/TCP (502)** for field device passthrough. Field rollout began in Q3 2025 and the pilot is scheduled for review at end of Q2 2026.

Asset Tag	Site	Device Role	Access	Status
FG-SNT-014	Substation North-3	Sentinel Gateway (Modbus/TCP)	Internal only	Active
FG-SNT-015	Substation North-3	HMI Relay	Internal only	Active
FG-SNT-021	Generation Unit 2	Sentinel Gateway (Modbus/TCP)	Internal only	Active
FG-SNT-022	Generation Unit 2	Engineering Workstation	Internal only	Active
FG-SNT-030	Substation East-1	Sentinel Gateway — Remote Pilot Console	Public (pilot)	Commissioning

3. Remote Access & Identification Notes

The pilot console identifies itself with the page title "**Industrial Gateway Management Console**" and responds on ports 80, 102, and 502. This identifier should be used by OT engineering staff to confirm they have reached the correct pilot asset during remote diagnostics. The exact address of the pilot console is intentionally omitted from this document for access-control reasons; authorized staff should retrieve it through the OT Security asset register. Any instance of this console found through a public search engine should be reported immediately to OT Security.

4. Distribution

This inventory is maintained by FalconGrid Power Division OT Engineering and is intended solely for internal engineering and authorized vendor support personnel working under Project Sentinel. Contact: ot-engineering@falcongrid-corp.example for access questions.
